iRoya Investment Proposal

Twelve month deployment staffing and operations plan

29 October 2026 | Prepared by iRoya

We propose an investment of **NGN 2,410,000 for 10% equity** in iRoya. The funding will support one year of production hosting, two staff members at NGN 25,000 each per month, and an additional NGN 1,000,000 operations budget.

Investment term	Proposed basis
New capital for iRoya	NGN 2,410,000
Investor ownership after investment	10% on a fully diluted post investment basis
Implied post investment value	NGN 24,100,000
Implied pre investment value	NGN 21,690,000
Planned funding period	12 months from receipt of funds

The business

iRoya is hotel booking and operations software for independent hotels in Nigeria. It gives hotels a shared record of rooms, rates and availability, with a guest booking flow and tools for reservations, room readiness and daily hotel work.

The proposed launch approach is to onboard a small group of independent hotels, help staff use the product consistently, and validate whether hotels will pay for the service before expanding acquisition spending.

Current product position

The existing product includes hotel and guest workspaces, inventory and rate management, front desk reservations, housekeeping workflows, payment integration and reservation communication. These capabilities are established in the project repository [4]. They should be demonstrated with configured services during investor review.

This is an early stage funding proposal. The financial examples are planning assumptions rather than claims of existing customers, revenue or profitability. Public rollout remains subject to completion of the release and payment acceptance checks.

Investment purpose

The immediate goal is a controlled operating launch supported by a small team. The budget assumes the existing software and founder technical oversight are available; it does not fund a new build from scratch.

Twelve month cost breakdown

All totals are in Nigerian naira. Cloud charges are converted using a planning rate of **NGN 1,500 per USD**, not a guaranteed bank or card conversion rate. The two salaries and operations amount follow the requested budget.

Cost item	Monthly NGN	Annual NGN
Staff member one	25,000	300,000
Staff member two	25,000	300,000
Vercel Pro one deploying seat [1]	30,000	360,000
Supabase Pro one project [2]	37,500	450,000
Operations allocation	83,333.33	1,000,000
Total proposed funding	200,833.33	2,410,000

How deployment is calculated

Vercel Pro is budgeted at USD 20 per month for one deploying seat [1]. Supabase Pro starts at USD 25 per month for one production project [2]. Combined hosting is USD 45 per month, or USD 540 over twelve monthly billing periods. At NGN 1,500 per USD, this is NGN 810,000 per year.

The staff calculation is 2 × NGN 25,000 × 12 = **NGN 600,000**. Hosting of NGN 810,000 plus staffing of NGN 600,000 plus operations of NGN 1,000,000 gives the proposed **NGN 2,410,000** investment.

Suggested operations allocation

Operations use	Annual NGN
Domain email data and general administration	180,000
Hotel onboarding and local visits	250,000
Promotion and sales materials	250,000
Minor maintenance and support tools	150,000
Operating buffer	170,000
Total operations allocation	1,000,000

The operations split is proposed and can be reallocated within its NGN 1,000,000 ceiling. The domain and email allowance is not a registrar quote. One off deployment labour is assumed to be handled by the founder; any external setup fee must be separately quoted.

Launch plan and commercial approach

Team responsibilities

Staff member one will support hotel onboarding, property information and hotel account follow up. **Staff member two** will handle guest enquiries, reservation follow up and routine administrative support. Each role is budgeted at NGN 25,000 monthly. Technical deployment, product ownership and escalation remain with the founder under this lean plan.

Proposed milestones

Period	Delivery target
Month one	Complete release checks and production setup; verify domain email monitoring and booking payment flows.
Months two and three	Recruit three pilot hotels; train hotel contacts; measure real usage and support needs.
Months four to six	Target ten active hotels and validate willingness to pay; review spend and retention monthly.
Months seven to twelve	Target fifteen paying hotels if pilot results justify pricing; prioritise retention over paid expansion.

Pricing to validate

A proposed starting subscription is **NGN 15,000 per hotel per month**. This price is a commercial test, not a claim that billing or customer contracts are already in place. No booking commission or other income is assumed in the funding budget.

Illustrative monthly cost coverage

Paying hotels	Gross revenue NGN	After collection fees NGN
10	150,000	146,750
15	225,000	220,125
20	300,000	293,500

The collection example uses Paystack local pricing of 1.5% plus NGN 100 per subscription payment [3], giving a NGN 325 fee on NGN 15,000. Fourteen subscribers would leave NGN 205,450 after these collection fees, slightly above the average monthly budget of NGN 200,833.33.

This is a cost coverage illustration, not a profit forecast. It excludes taxes, refunds, failed collections and additional transaction or employment costs. Booking payment fees are separate and must be allocated before commercial booking operations. Hotel onboarding and revenue targets are not guaranteed.

Equity terms assumptions and review

Proposed investment structure

The NGN 2,410,000 is proposed as new money paid into the business in exchange for newly issued shares representing **10% of fully diluted ownership immediately after the investment**. Existing holders collectively retain 90% at that point, subject to verification of the current ownership structure and any options or other outstanding rights.

The implied valuation follows the proposed ownership percentage: NGN 2,410,000 ÷ 10% = **NGN 24,100,000 post investment**. Subtracting the investment gives **NGN 21,690,000 pre investment**. These are negotiated offer values, not an independent valuation or a measure of the historical cost of development.

The proposal is for equity ownership rather than a loan or a guaranteed financial return. Future investment rounds may dilute ownership. Detailed investor rights, share class, approvals and closing requirements will be settled in definitive documents after review of the legal entity, ownership records and software rights.

Budget boundaries and sensitivity

The hosting estimate covers one production project and one deploying Vercel account within included allowances. Additional paid seats, overages, backup upgrades, foreign card charges and taxes can increase spend. The operations buffer should be monitored against these costs. New hardware, a founder salary, major redevelopment and externally charged deployment labour are not separately included.

Planning FX rate NGN per USD	Hosting per year NGN	Total budget NGN
1,300	702,000	2,302,000
1,500	810,000	2,410,000
1,700	918,000	2,518,000

Investment review and reporting

Before closing, confirm ownership and company details, demonstrate the product, validate remaining release gates, and agree the budget and reporting process. Proposed monthly reporting covers cash spent, runway, active hotels, paying hotels, booking activity, support issues and product reliability.
